**To Control Sprouting or Sucker Growth on Hazelnuts (Filberts) - Non-bearing Only**

Apply Tre-Hold Sprout Inhibitor A-112 as a directed spray to the lower tree trunks and immediate surrounding area. Best results are obtained when the first treatment is made after the trees resume growth and suckers become visible (usually between late April to May). For best results, treat early before suckers attain 3" in length. Dilute Tre-Hold Sprout Inhibitor A-112 in the correct amount of water to prepare a 1% A.I. solution (see dilution chart). Add a non-ionic surfactant (NIS) at 0.25% v/v. Make applications in a diluent volume of 20 to 44 gallons per acre using spray nozzle that will deliver a coarse droplet directed to the base of the trees. For best results, retreat after 30 days. Apply by ground application equipment only.
